A QUICK GUIDE TO
Timber Treatment
for Enclosed Framing

Department of
Building and Housing
Te Tari Kaupapa Whare

PINK IS TOUGH

H1.2 FRAMES IT RIGHT
A new timber treatment system for Acceptable Solution B2/AS1:

- **tough** against fungal decay and insect attack
- simpler and easier to use
- protects framing from decay
- time and cost effective.

Timber treatment in Acceptable Solution B2/AS1 has changed to a new, simpler system:

---

**If you are using the Acceptable Solution to demonstrate compliance with the Building Code, H1.2 is now required for nearly all radiata pine and Douglas fir enclosed timber framing.**

---

**FOR TIMBER FRAMING WITH:**

- Cantilevered enclosed balcony and balustrade
- Enclosed balcony and balustrade with living space below
- Enclosed balcony and balustrade open below

H5 post if in contact with the ground.
What’s new with timber treatment?
The Acceptable Solution B2/AS1 has changed. The timber treatment hazard class H1.2 is now required for radiata pine and Douglas fir timber in buildings, where it is protected from the weather (i.e., enclosed timber framing). Consult the tables in this booklet for the few exceptions to H1.2 treatment.

Why H1.2?
Research shows that H1.2 gives framing timber good protection from decay. H1.2 boron treatment is colour-coded pink.

How can I be sure my timber framing complies with the Building Code?
The changes in this booklet outline one way to comply with the New Zealand Building Code durability clause B2. However, the booklet is only a quick guide, so consult Acceptable Solution B2/AS1 for full details.

Why continue to treat timber?
Timber must be adequately protected against damage from fungal and insect attack so that buildings are durable and comply with the Building Code. The new system improves the overall level of protection against decay.

What about other species of wood for framing?
For other species of wood and engineered wood products (such as LVL and Glulam), the Acceptable Solution does not change. For information on other species which can be used under the Acceptable Solution, consult NZS 3602:2003 Tables 1 and 2.
THE BUILDING CODE AND ACCEPTABLE SOLUTION B2/AS1

This booklet is a quick guide to timber treatment changes in the Acceptable Solution B2/AS1. Designers should consult B2/AS1 itself for more information on timber treatment.

The Department of Building and Housing’s Acceptable Solution B2/AS1 can be found in the B2 (Durability) Compliance Document at: www.dbh.govt.nz/compliance-documents

GLOSSARY

BUILDING CODE AND B2
The Building Code sets out performance standards that building work must meet. It has 35 technical clauses covering requirements such as managing external moisture, structure and ventilation. Clause B2 is the technical clause for durability and includes timber treatment. It sets out the durability requirements for all building elements.

ACCEPTABLE SOLUTION
An Acceptable Solution details one way to comply with the relevant part of the Building Code. If you follow this method, your building work will meet that part of the Building Code. B2/AS1 is an Acceptable Solution for clause B2 (Durability) of the Building Code.

There can be ways of complying with the Building Code other than through an Acceptable Solution – these are often called alternative solutions.

H1.2
This is a hazard class for timber treatment. A hazard class defines the risk and the level of timber treatment, as specified in NZS 3640 and NZS 3602.

BUILDING ENVELOPE
This describes the exterior surfaces (wall cladding, roofing, windows and doors) of a building.
### Where Timber Treatments Are Used

</tbody>
</table>

**Note 1:** For structural use of other species, refer to NZS 3602:2003 Tables 1 and 2.

**Note 2:** For non-structural use of radiata pine, Douglas fir and other species, refer to NZS 3602:2003 Table 3.

**Note 3:** A higher treatment level also satisfies the level specified in this table.
UNTREATED DOUGLAS FIR

The new timber treatment system for Acceptable Solution B2/AS1 allows untreated Douglas fir to be used in houses of a defined low-risk design. Research shows that Douglas fir resists decay better than untreated radiata pine, but not as well as H1.2 treated timber.

Untreated solid Douglas fir framing can be used for a house of no more than two storeys (as defined in NZS 3604), that is designed and constructed to NZS 3604, if ALL the following low-risk conditions are met:
<table>
<thead>
<tr>
<th>✓</th>
<th><strong>LOW-RISK HOUSE CONDITIONS</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>is a standalone, single household unit of no more than two storeys (as defined in NZS 3604), that is designed and constructed to NZS 3604 <strong>AND</strong></td>
</tr>
<tr>
<td></td>
<td>is situated in wind zones no greater than ‘high’ as defined in NZS 3604 <strong>AND</strong></td>
</tr>
<tr>
<td></td>
<td>has a building envelope complexity no greater than ‘medium risk’, and a deck design no greater than ‘low risk’, as defined by the risk matrix in the Acceptable Solution E2/AS1 <strong>AND</strong></td>
</tr>
<tr>
<td></td>
<td>has drained and vented cavities complying with E2/AS1, behind all claddings <strong>AND</strong></td>
</tr>
<tr>
<td></td>
<td>uses roof and wall cladding systems and details meeting E2/AS1 <strong>AND</strong></td>
</tr>
<tr>
<td></td>
<td>has a risk matrix score of no more than 6 on any external wall face, as defined in E2/AS1 <strong>AND</strong></td>
</tr>
<tr>
<td></td>
<td>has a simple pitched roof with hips, valleys, gables, or mono pitches, all draining directly to external gutters* <strong>AND</strong></td>
</tr>
<tr>
<td></td>
<td>has a roof slope of 10° or more <strong>AND</strong></td>
</tr>
<tr>
<td></td>
<td>if it has a skillion roof, the roofing material is corrugated iron or concrete, metal or clay tiles for adequate ventilation <strong>AND</strong></td>
</tr>
<tr>
<td></td>
<td>has eaves 450mm-wide or more for single-storey houses, and eaves 600mm-wide or more for two-storey houses.</td>
</tr>
</tbody>
</table>

* The roof does not have internal or secret gutters, concealed gutters behind fascias, or any roof element finishing within the boundaries formed by exterior walls (eg, the lower ends of apron flashings, chimneys, dormers, clerestories, box windows).
WHEN DOES THE NEW SYSTEM START?

From 4 April 2011 to 30 June 2011, both the previous B2/AS1 (amendment 6) and the new B2/AS1 (amendment 7) can be used as an Acceptable Solution for consenting purposes.

From 1 July 2011 onwards, only the new B2/AS1 can be used as an Acceptable Solution.

Know the new system – and frame it right first time.
SAFETY AND HEALTH

Timber treatments generally consist of chemicals that need to be handled safely and appropriately. Important measures to take when using treated timber, especially hazard classes H3 and above, are:

• reduce contact by wearing gloves, goggles and a dust mask
• don’t burn off-cuts or cook with them
• dispose of waste in an approved landfill
• wash your hands before using the toilet, smoking or eating
• wash work clothes separately
• ventilate work spaces as much as you can
• working with solvent-damp timber is not advised, solvent-damp timber should be allowed to properly dry off before use.

Note: Boron has been used commercially as a timber preservative in New Zealand since the 1950s, with no known health issues for timber users or building inhabitants.
